- D. Assessment B – Existing Lighting Calculation with reduction measures applied

1. Introduction

This External Lighting Assessment has been prepared by Waterman Building Services in support of a full planning application for the continued use and operation of the Sevington Inland Border Facility (IBF), Ashford, TN25 6GE (hereafter referred to as the Site) on behalf of Department for Transport (DFT), His Majesty's Revenue & Customs (HMRC) & Department for Environment, Food & Rural Affairs (Defra).

This document identifies the present arrangement and operation of the existing external lighting scheme for the Sevington Inland Boarder Facility and the assessment undertaken to determine the present lighting levels and lighting control strategy associated with the site.

Based upon the existing calculated lighting levels and the subsequent lighting survey undertaken on 2nd April 2025 (refer to External Lighting Report Revision P02 dated 22nd April 25), this report provides recommendations to address any non-compliant issues, taking into account the recorded feedback from local residences and the measures which the Inland Border Facility have undertaken to date.

This report has been based on the information and drawings Waterman Building Services received:

- External Lighting Survey Report (revision P02 dated 22nd April 2025)
- Existing External Lighting Drawing No. 49502-MMD-01-MO-DR-E-1361 Rev P04.
- Existing External Luminaire Schedule
- Lighting Calculations of existing & proposed prepared by Lighting manufacturer, which comprises:
 - LS16272-1-1- Layout.
 - LS16272-1-2-2 Layout
 - LS16272-1-2-1 Layout
 - LS16272-1-2-3 Layout

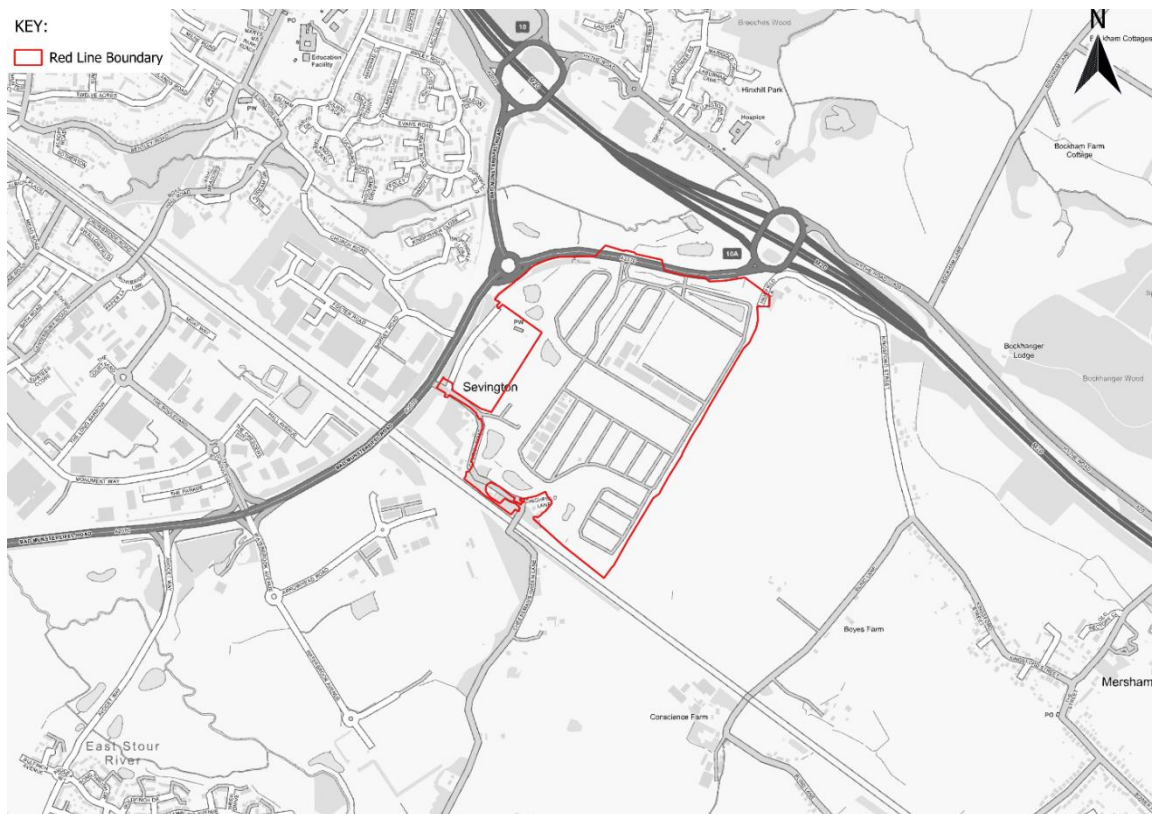

Additional guidance has been provided by the client with regards to external lighting control operation and the additional measures undertaken to minimise the lighting impact to neighbouring residences.

1.1 Site Description

The Application Site is centred on National Grid Reference TR 03976 40758 and is located within the administrative boundary of Ashford Borough Council (ABC) and Kent County Council (KCC).

As illustrated in Image 1, the Application Site is located in Sevington, south-east of Ashford in Kent, Postcode: TN25 6GE. This is a semi-rural area on the outskirts of Ashford, with a mixture of residential and commercial land uses located to the north and west of the Application Site but with agricultural land use to the south and east.

Image 1: Site Location

The Application Site occupies an area of approximately 48 hectares (ha) and is bound by:

- The A2070 Link Road and M20 motorway (M20 Junction 10a), to the north.
- Highfield Lane and Kingsford Street to the east and north-east respectively.
- Highfield Lane and Church Road, to the south.
- Church Road, St Marys Church and A2070 to the west.

The images below identify the location of the existing neighbouring residential areas, high-lighted in light blue :

Image 2a: Existing Neighbouring Residential Areas

Image 2b: Existing Neighbouring Residential Areas

2. Design Considerations

2.1 Planning Requirements

Below are the planning requirements and standards that are related to this report:

National Planning Policy Framework (2025)

Local Planning Authority (LPA) Requirements

Ashford Local Plan 2030 (Adopted February 2019)

Ashford Local Plan Dark Skies SPD (Adopted July 2014)

British Standards & CIBSE Guidance:

BS 5489-1:2020 – Road Lighting, including pedestrian and security lighting.

BS EN 12464-2:2024 – Lighting of Outdoor Workplaces (e.g., logistics hubs, border facilities).

CIBSE LG6 – The Exterior Environment – Covers general outdoor lighting principles.

CIBSE LG13 – Outdoor Workplace Lighting – Specific to areas like loading bays, car parks, and border facilities.

Clean Neighbourhoods and Environment Act 2005 – Excessive lighting can be classified as a statutory nuisance if it causes significant intrusion into residential properties.

2.2 Design Criteria Considerations

The external lighting design should be based upon British Standard BS-EN 12464:2024 – Lighting of Outdoor Workspaces (e.g., logistics hubs, border facilities). Table 1 is an extract from the British Standard defining the lighting requirements for the Sevington Inland Border Facility (external area lorry parking areas).

Table 1: Lighting Design Criteria

Area	Required Average Lux Levels	Uniformity	Glare	Colour Temperature (K)
Industrial Sites	100	0.5	45	4000

The Ashford Local Plan Dark Skies (Policy ENV4) – Light Pollution & Promoting Dark Skies - identifies the considerations which should be taken into account with regards to addressing obtrusive lighting limitation zones in conjunction with the Institution of Lighting Professionals (ILP). The environmental zoning identifies the 'What is acceptable' between Zones E0 to E4. It is considered that the site falls within zone E04.

3. Existing External Lighting Installation

3.1 General

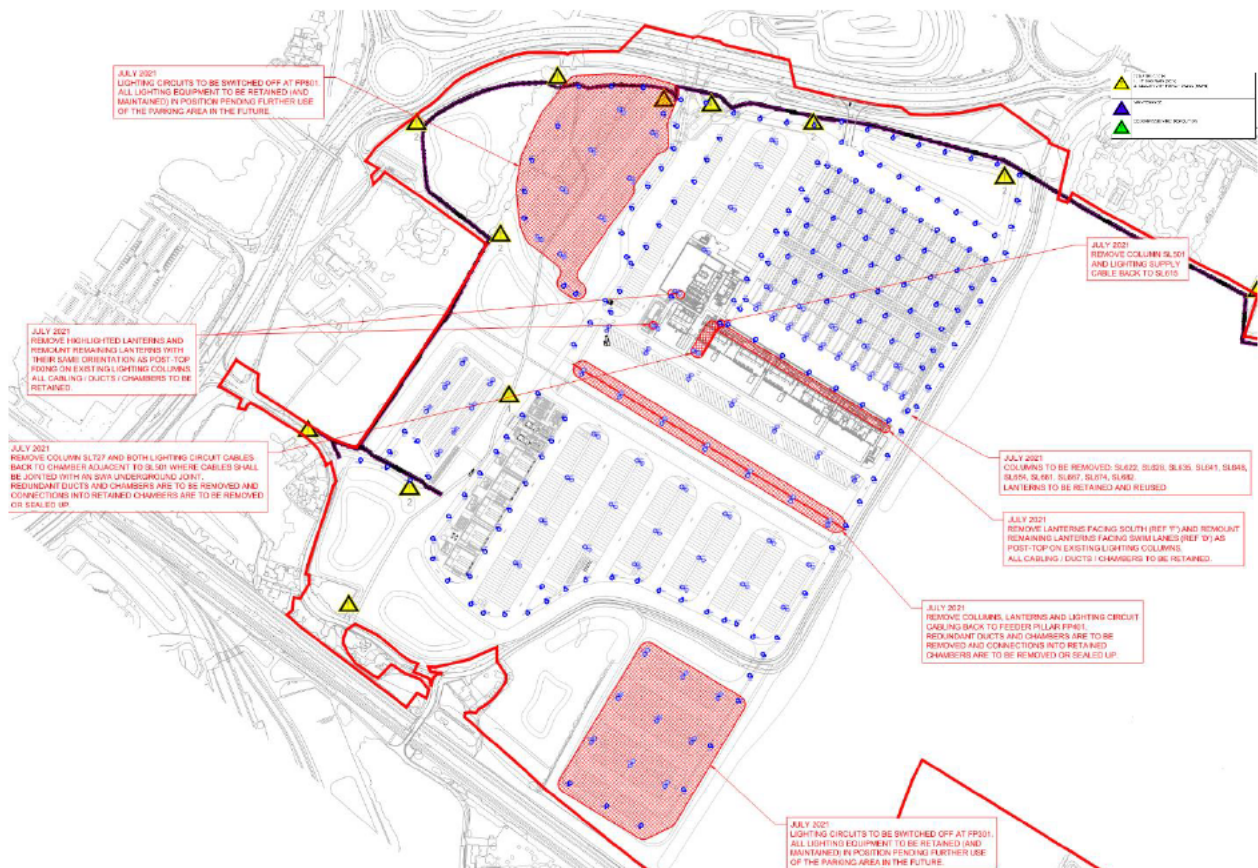

The existing lighting installation comprises 339No. external light fittings with a mounting height ranging between 8 to 12 meters.

Refer to Appendix A regarding the external lighting drawing (reference: 419419-MMD-01-MO-DR-E-1361, REV P04) produced by Mott MacDonald and Appendix B for the associated luminaire schedule.

The image 3 below is an extract from the existing lighting drawing (419419-MMD-01-MO-DR-E-1361 Rev P04). Revision P04 incorporates the modifications carried out following the review of the installation in July 2021 to reduce the light spillage beyond the site boundary.

This layout has been used to simulate design lux plots and assess the extent of light spill beyond the site boundary and into neighbouring residential areas.

Image 3: Existing External Lighting Installation Drawing

3.2 External Lighting Operating Periods

As the existing and intended ongoing use of IBF is to inspect the goods within lorries and to make sure that no contraband, dangerous substances or any illegal item/action pass through the UK, the site is required to operate 24/7 and therefore the external lighting is required to be on during the hours of darkness.

3.3 Present Measures Implemented to Reduce Light Spillage

A Technical Note was produced by Mott MacDonald dated 19th November 2021, following a light survey which was carried out during May 2021 (survey report not provided as part of this assessment).

The technical note confirmed the following modifications were implemented:

- The lights in the north-western (Romeo) and south-eastern areas of the site (Tango) have been switched off. These areas will be used only in emergencies.
- Lighting columns in the viewing corridor running through the centre of the site have been switched off and removed.
- Baffles have been installed on luminaires in close proximity to residents adjacent to the Site.
- All permanent lighting lanterns have been aligned to ensure they are fully horizontal and not tilted.

The Technical note states that a further check was undertaken by lighting engineers during September 2021 to identify whether the above recommendations were sufficiently implemented and that the local response had been that the above recommendations have been largely successful and that there has been a noticeable improvement.

At the time of the Technical Note being issued a lighting control system was being installed, which will function to give the Site Operator the ability to dim or switch off the lighting in non-operational or reduced-operation areas overnight. We are advised that the lighting control is installed and operational.

In addition to the measures identified by the Mott MacDonald Technical Note dated 19th November 2021 (hi-lighted in the image below in pink), the FM team have also removed the external luminaires on the side façade of Inspection Shed 5 and turned off the external luminaires on the rear façade of Inspection Shed 4 and Inspection Shed 5 (indicated in orange in Image 4).

Image 4: Removed Or Turned Off External Light Fittings.

4. Existing Lighting Control Strategy

4.1 Present Lighting Control Description

Across the Sevington site, multiple lighting control systems have been installed for different areas on the site. The lighting control systems currently installed on the Sevington site are as follows:

- Photocells and a Master Photocell
- Manual Switching
- WEB/Remote Switching
- Time Clocks

In order to address the light spill, the operator has arranged for certain lights to be turned off or removed from the site. The Emergency Holding Areas for Commercial Goods Vehicles Carparks labelled 'Romeo' and 'Tango' shall remain switched off under normal conditions and only operated under emergency conditions when overspill parking is required.

The external luminaires mounted on the side of building 'Inspection Shed 5' have been permanently removed and the external lights on the rear of buildings 'Inspection Shed 4' and 'Inspection Shed 5' have been fully isolated to the 'off' to ensure they are permanently off to address the light spill into the residential area 1.

All the external lighting on site is controlled by Photocells and a Master Photocell. When the daylight lux levels reach 80 lumens, the photocells and Master Photocell turn on the external light fittings. When the daylight lux levels reach 120 lumens, the photocells and Master Photocell turn off the external light fittings.

The lorry swim lanes located to the North- East of the IBF site is remotely controlled from WEB/Remote switching. When a 'swim lane' isn't being used, the external lights are kept off to reduce the light spill emitted from the site and to reduce energy costs from the external lighting. We understand that this is a more recent mitigation initiative in response to the consultation feedback to this application.

5. External Lighting Assessment

5.1 General

The existing external lighting drawing produced by Mott MacDonald (ref: 49502-MMD-01-MO-DR-E-1361 Rev P04) has been used to prepare the lighting calculations to simulate the following scenarios:

Assessment A : Lighting levels based upon the original scheme with all external lighting operational.

Assessment B : Lighting levels based upon the measures implemented as part of the Mott MacDonald Technical Note (dated 19th November 2021) implemented and subsequent measure incorporated.

5.2 Observations

Based upon the lighting calculations simulations located in Appendix C & D, the following lux levels have been recorded for the residential areas in the Table 2.

Table 2: Lux Plot Results

Assessment	Res Area 1		Resi Area 2		Resi Area 3	
	Average Lux Level at Boundary	Lux Level beyond boundary	Average Lux Level at Boundary	Lux Level beyond boundary	Average Lux Level at Boundary	Lux Level beyond boundary
Assessment A	0.2 Lux	0.2 Lux	0.2 Lux	0 Lux	0.2 Lux	0 Lux
Assessment B	0.2 Lux	0 Lux	0.2 Lux	0 Lux	0 Lux	0 Lux

Image 5: Residential Areas that are in Close Proximity to the Site

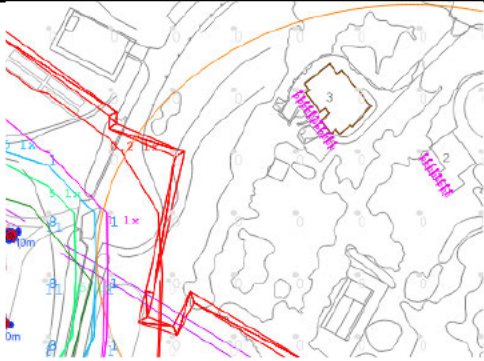

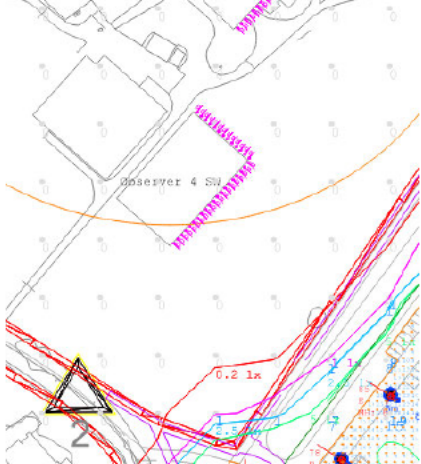

Note the lux readings beyond the boundary do not take into consideration any existing physical barriers such as trees and hedges which would reduce the lux levels further.

Table 3 provides extracts from the lighting calculations indicating the lux contours for the 3 residential areas for Assessment A & Assessment B.

Where the lux contour lines represent the following:

- Green Contour Line - 5.0 Lux
- Blue Contour line - 2.0 Lux
- Purple Contour line - 1.0 Lux
- Red Contour Line - 0.2 Lux

Table 3: Lux Plot Images of the Residential Area

Area	Assessment A	Assessment B
Residential Area 1		
Residential Area 2		
Residential Area 3		

6. External Lighting Survey

The external lighting survey report dated 22nd April 2025 (revision P02) indicates that the lux level readings at the site boundary areas are similar to the calculated values previously undertaken. However, the photographs within the report provide clarity on the extent of direct glare and upward light spillage.

7. Conclusions and Recommendations

Based upon the lux plot design simulations for Assessment A (original scheme) and Assessment B (all lighting reduction measures applied), the results indicate that Assessment B reduces the lux levels to a compliant level between 0 - 0.2 lux at the site boundary adjacent to the residential areas.

The conclusion of the External Lighting Survey report (revision P02) dated 22nd April 2025, has made the following statement and recommendations:

Based upon the external lighting site survey it is noted that although the lux levels recorded at the relevant site boundaries are of acceptable levels, the main issue is the direct glare from the site luminaires and the percentage of upward light which is noticeable from the site photographs.

The photographs within the survey report demonstrate the extent of glare being experienced at the given locations. The photographs also identify upward light which could be considered as contravening the Ashford Local Plan Dark Skies (Policy ENV4).

The survey report recommends that the following course of action is considered to address the issues identified:

1. All column luminaires to be fitted with baffles to remove the impact of direct glare.
2. Consideration of dimming of the luminaires to a lower wattage in different areas of the site to create a lower average lux level and minimise the indirect light spillage which appears to be impacting on the dark sky issue due to potential reflection from the finished road surfaces.
3. Review the capability of the lighting control system to assess the flexibility of switching off certain circuits at night.
4. Assess the actual operation of the site to determine areas which are not always needed to be operational on a daily basis and control those areas accordingly using the lighting control system to switch off certain circuits at night.

Further to the above, the FM team have advised they are in the process of preparing an implementation plan to reduce lighting at night by switching off a selection of the lighting circuits and dimming other lighting circuits, where operationally feasible. We suggest this plan is obtained and reviewed and that a programme of monitoring and recording is implemented.

Appendices

A. Existing Luminaire Schedule

LUMINAIRE SCHEDULE

The following luminaire manufacturers have been selected to benchmark the proposed standard and performance perimeters that shall be applied.

Ref.	Image	Manufacturer	Description	Catalog Ref.	Lamp Output & Efficiency	Colour Temp. (K)	Comments

Luminous Intensity (Cd) At Vertical Planes

Maximum Allowable Value calculated from CIE 150:2017 (varies by Projected Area sq.m. and Distance Factor)

For E2-Low District Brightness, Projected Area and Distance Factors:

(0.002, 0.57) (0.01, 1.3) (0.03, 2.5) (0.13, 5) (0.5, 10)

Projected Area (sq.m) = Approx. projected emitting area of luminaire in direction of observer

Distance (m) = Distance from luminaire to observer

Max Cd Allowed = Projected Area Factor * Distance

This Drawing is a photometric design on a horizontal plane unless stated otherwise. Lighting levels may deviate from those shown due to tolerances in light source geometry, surface reflectance, luminaire installation position, luminaire and light source performance and electrical supply and any obstructions within the area. It should be noted that light sources depreciate with use. Maintenance Factor assumed in the design is shown below.

To achieve flood light aiming angles, flood lights may need to be mounted above and below the bracket arm. Please contact CU Phosco Lighting if more information is required. This drawing must not be reproduced without the permission of CU Phosco Lighting.

Lighting Impact Assessment

This drawing is a photometric design on a horizontal plane unless stated otherwise. Lighting levels may deviate from those shown due to tolerances in light source geometry, surface reflectance, luminaire installation position, luminaire and light source performance and electrical supply and any obstructions within the area. It should be noted that light sources depreciate with use. Maintenance Factor assumed in the design is shown below.

To achieve flood light aiming angles, flood lights may need to be mounted above and below the bracket arm. Please contact CU Phosco Lighting if more information is required. This drawing must not be reproduced without the permission of CU Phosco Lighting.

Luminous Intensity (Cd) At Vertical Planes

Maximum Allowable Value calculated from CIE 150:2017 (varies by Projected Area sq.m. and Distance Factor)
For E2-Low District Brightness, Projected Area and Distance Factors:
(0.002, 0.57) (0.01, 1.3) (0.03, 2.5) (0.13, 5) (0.5, 10)

Calculations Tested (15):

Calculation Label	Test Results
Observer 1 NE 1-8m- Kingsford St_Cd_Seg1	PASS
Observer 1 NE 1-8m- Kingsford St_Cd_Seg2	PASS
Observer 1 NE 1-8m- Kingsford St_Cd_Seg3	PASS

We are Waterman, where every project matters

We deliver progressive, sustainability-driven environmental and engineering consultancy services across every sector. We think differently, and we're harnessing our collective expertise to deliver greener, healthier and well-connected communities, networks and built environments.

Based in strategic locations throughout the UK and Ireland, our team of specialists is at the forefront of tackling the climate emergency and forging a path to a Net Zero built environment.
